Adult Healthy Weight

Adult Healthy Weight (for ages 18 and up)

What is My Healthy Weight and Why Does It Matter?

While your weight is a number measured by a scale, your “healthy weight” is a determination made by a clinician, and is based on multiple factors, which can include body mass index, waist circumference, fat, and muscle composition, as well as other factors.

Being heavier than your healthy weight can result in multiple chronic illnesses like diabetes, high blood pressure, and heart disease... and being significantly heavier or lighter than your healthy weight can increase your chances of more serious consequences of these and other conditions.

Body Mass Index (BMI)

Body mass index (BMI) is a calculation of your weight and height (your weight in kilograms divided by the square of your height in meters). Please note that the BMI is not diagnostic by itself of healthy weight; it is just one data point used by your clinician to determine a healthy weight range for you.

Waist Circumference

Waist circumference is another screening tool used to determine your healthy weight. Waist circumference is most often based on abdominal fat (belly fat). Too much abdominal fat increases your risk of developing chronic medical conditions (such as diabetes, high blood pressure, and heart disease). Please also note that a healthy waist circumference varies, based on race and ethnicity.

Your clinician can determine a healthy weight and waist circumstance range for you, and if weight loss (or gain) would be likely to benefit your health.

Healthy Eating for a Healthy Weight

Healthy eating is not just for people who are trying to lose weight. Healthy eating can help everyone stay healthier by reducing your risk of developing many chronic illnesses; or if you already have chronic illnesses, of being less sick from them. There is no diet that is right for everyone. In general, a healthy diet for you should:

- Include vegetables, whole fruits, whole grains, fat-free or low-fat dairy (if not lactose-intolerant), and protein rich foods including seafoods, nuts and lentils.
- Favor vegetable oils over animal fats.

- Limit the foods and beverages with added sugars, saturated fat, and sodium. Less than 10% of calories per day should come from added sugars and saturated fat.
- Avoid too much sodium (salt). Daily total sodium should be kept to less than 2300mg / day unless your clinician recommends otherwise.
- Avoid alcohol if pregnant. Do not start drinking alcohol to try to improve your health status. If you drink alcohol, please limit your consumption to no more than two drinks per day for males, and one drink per day for females.

Physical Activity for a Healthy Weight

Regular physical activity is important for good health, and it's especially important if you're trying to achieve and maintain a healthy weight. Physical activity also helps to: reduce blood pressure; reduce your risk for diabetes, heart attack and stroke; reduce pain from arthritis; and reduce symptoms of depression and anxiety.

The CDC recommends:

- Either at least 150 minutes / week of moderate intensity physical activity, or at least 75 minutes / week of vigorous intensity physical activity. An example of moderate intensity activity is brisk walking, and an example of vigorous activity is jogging or running.
- Muscle strengthening activities two or more days a week, where you work on all major muscle groups (such as your arms, legs, shoulders, chest, back, hips, and abdomen). Examples of muscle strengthening exercise include gardening with digging or shoveling, lifting weights, resistance training, and certain types of yoga.

If you have any significant medical conditions or physical impairments or disabilities – do not start a new exercise program without first consulting your clinician.

If you are interested in achieving a healthy weight, please discuss with your clinician for further tips and/or referrals.
